MIDUS Milwaukee Wave 2 Field Report.....	27

OVERVIEW OF PROJECT

The University of Wisconsin Survey Center (UWSC) was hired by Professor Carol Ryff, Director of the University of Wisconsin Institute on Aging (UW-IOA), to conduct the third wave of the Midlife in the United States (MIDUS) study. This multidisciplinary investigation, led by researchers from across the United States, seeks to understand how factors in the lives of American adults such as working conditions, relationships, health, finances, personal outlooks and individual choices impact health and well-being as individuals age from early adulthood to later life. This third wave of the study—known as MIDUS 3--also sought to shed light on how U.S. adults have been impacted by the 2008 economic recession and how these experiences are linked with their health, broadly defined.

Funded by the National Institute on Aging, the MIDUS 3 initiative returns to the 4460 living longitudinal sample who participated in MIDUS 2. Participants were recruited into MIDUS 3 via an initial 45-minute telephone interview, and were then invited to complete a 100-page mail questionnaire and a 25-minute cognitive interview via telephone.

From May, 2013, through November, 2014, 3,294 respondents completed the initial telephone interviews, 2,732 returned self-administered questionnaires (SAQs), and 2,693 participated in the cognitive interviews. In addition, family members of 33 respondents, who were deceased, participated in a brief mortality cognitive closeout interview.

The response rate for the MIDUS 3 telephone interview was 77%. The response rate for the MIDUS 3 self-administered questionnaire was 83%. The response rate for the MIDUS 3 cognitive interview was 83%.

See Appendix A for a timeline showing field dates of each protocol. See Appendix B for a full discussion of response by protocol. All Appendices are available by request from the MIDUS Administrative Core. Please contact midus_help@aging.wisc.edu

See the MIDUS 3 Cognitive Interview Field Report for a full discussion of cognitive interview protocols and response.

The University of Wisconsin Survey Center

Founded in 1987, the UW Survey Center (UWSC) serves the survey research needs of a wide variety of clients including faculty, staff, and administration at the University of Wisconsin; faculty and staff at other universities; federal, state, and local governmental agencies; and not-for-profit organizations. A department in the College of Letters and Science of the University of Wisconsin—Madison, the UWSC provides a complete range of survey research capabilities. The mission of the Survey Center is to assist researchers by providing the highest quality survey research services.

Professor Nora Cate Schaeffer is the Faculty Director of the UWSC. John Stevenson is the Associate Director, Kelly Elver is the Director of Project Management, and Steven Coombs is the Field Director. Vicki Lein served as senior project director on the MIDUS 3 project, and oversaw data collection in both telephone interviews. Griselle Sanchez served as project director for the questionnaire data collection. Other key UWSC staff included:

Programming Staff

- Eric White, Technology Director. General oversight of all programming and technology programming staff. Responsible for setting up a secure file transfer protocol for daily delivery of MIDUS cognitive interview audio files.
- August Salick, MIDUS CASES programmer. Responsible for initial recruit telephone instrument and cognitive telephone instrument programming, project management system development, and Shell database development.
- Brendan Day MYSQL and CASES programmer. Responsible for creation of contact tracing database, and occupation and industry coding database.
- Kate Golan, CASES programmer. Responsible for programming and data delivery support.
- Dan Lawrence, CASES programmer. Responsible for programming the questionnaire data entry database.

Tracking and Locating

- Robert Breen, Tracking and Locating Supervisor. General oversight of tracking locating operations.
- John Matoushek, Tracking and Locating.

Field Staff, Call Center

- Robert Schultz, Garrett Wartenweiller, and Joe Degnitz, Call Center Supervisors. Responsible for hiring, training and supervising interviewers and shiftleaders in the Call Center. General oversight of calling on projects conducted by telephone.
- Linda Gomez, Leah Kutschke, Katie Odens, Katelyn Putz, Michael Turek, Paul Wade, Nora Brennan, and Meghan Eubanks. MIDUS Call Center Shiftleaders. Responsible for monitoring interviewers, finalizing cases, responding to respondent questions and referring issues for review by supervisors or project directors.
- Over 90 interviewers trained to call MIDUS 3.

Field Staff, Mail and Data Entry Center

- Carrie Barrett, Crystal Buttles, and Nick Shultz, UWSC Mail and Data Entry Center supervisors. Responsible for staffing and training of all Mail and Data Entry Center staff, and creating protocols unique to MIDUS data entry.
- Hilary Manley, Maria Richards, Brian Wood, Kate Manley, and Leo Schultz, Mail and Data Entry Center coordinators. Responsible for coordinating the preparation of all mailings of payments, questionnaire packets and letters to MIDUS respondents.
- Over 25 MIDUS-trained mail and data entry staff.

CASES Instruments

CASES CATI System

Recruitment and Cognitive interviews were conducted over the telephone using computer-assisted telephone interviewing (CATI) technology. The CATI system used by the UW Survey Center was CASES 5.5. CASES is copyrighted by the University of California-Berkeley's Computer-Assisted Survey Methods Program or CSM.

In the CASES CATI system, the text of the interview appears question by question on a computer screen for the interviewer to read to the respondent. Routing through the interview is based on pre-programmed skip logic. Question wording may be adapted according to answers previously given in the interview or based on pre-existing data in the sample record that has been imported into the system. The system allows for pre-coded questions, open-ended questions, and combinations of the two. In addition, the system allows only valid responses; when an invalid response is entered, the interviewer is asked to reenter the response.

For the cognitive interview, banners could be customized for each task, either providing interviewers cues on script timing, exactly when each item should be said, or providing a task timer to inform interviewers when the period for response had ended.

The CASES system keeps track of the current status of all sample telephone numbers, automatically routes them for proper follow-up for the next attempt, and maintains an elaborate set of management records.

CASES SAQ Data Entry System

The self-administered questionnaire (SAQ) data entry instrument was programmed for double data entry in CASES 5.5. In CASES, the text of the questionnaire appears question by question on a computer screen and the data entry operator enters the response provided by the respondent. Skip logic is pre-programmed into the system. The system allows for pre-coded questions, open-ended questions, and combinations of the two. In addition, the system allows only valid responses; when an invalid response is entered, the computer asks the data entry operator to reenter the response.

In double-data entry, such as with MIDUS, trained editors review all SAQs and clarify ambiguous response prior to first-pass data entry. When the second-pass data entry operator enters the response, CASES monitors discrepancies between first-pass and second-pass entries, and when any exist, loads a discrepancy screen requesting the second pass data entry operator to resolve the discrepancy.

UWSC programmed the system to track data entry operator error rates and used results for targeted training efforts.

BACKGROUND

MIDUS 1 launched in 1995 and recruited over 7,100 American adults, aged 25 to 74, into a national study on health and well-being. A panel of over a dozen researchers around the country, in fields ranging from psychology, sociology and anthropology, to medicine, and health care policy were involved in the MIDUS study. In addition to a main RDD national sample, MIDUS included a large subsample of 998 pairs of twins, the largest randomly drawn sample of twins in the United States. Also included was a sample of hundreds of siblings of the Main RDD respondents, as well as over-samples of different metropolitan areas in the U.S. The study's comprehensive, multimodal protocol included a 30-minute telephone interview, and a 100-page mail questionnaire. Further, some respondents also participated in a diary study of daily stress. MIDUS 1 was conducted at Harvard University and was sponsored by the John D. and Catherine T. MacArthur Foundation.

In 2004, **MIDUS 2** returned to the original MIDUS participants with a 45-minute telephone interview, a 100-page self-administered questionnaire, but also added a 25-minute cognitive interview via telephone and repeated and expanded the daily stress project. MIDUS 2 also introduced projects that collected comprehensive biomarkers and conducted affective neuroscience assessments. Longitudinal survey data were collected on 75% of the eligible living respondents from the baseline MIDUS 1 study. MIDUS 2 also included a new African-American oversample of over 500 individuals from Milwaukee, Wisconsin, recruited via in-home interviews. The MIDUS 2 survey and cognitive project data was collected by the UWSC and supported by funding from the National Institute on Aging.

The **MIDUS Refresher**, fielded in 2012, replenished the original longitudinal sample, diminished over time through attrition, with a younger cohort. New participants were American adults aged 25 to 74, mirroring the original MIDUS sample. Data collection protocols were similar to those used in the MIDUS longitudinal study, and included the cognitive, daily stress, biomarker, and neuroscience projects. MIDUS Refresher participants were recruited in a 45-minute telephone interview, then invited to complete a 108-page mail questionnaire and to participate in a 25-minute cognitive interview via telephone. Complete telephone data was obtained by 3,577 individuals. The MIDUS Refresher survey and cognitive data were collected by the UWSC and funded by the National Institute on Aging.

The **MIDUS Milwaukee Refresher** project, also fielded in 2012, recruited 508 new participants from Milwaukee, Wisconsin, African-American adults, aged 25 to 64. The MIDUS Milwaukee protocols included an in-home interview lasting an average of 2 hours and 40 minutes, a 44-page leave-behind questionnaire, and a 25-minute cognitive interview via telephone. The Milwaukee Refresher sample also participated in the biomarker and neuroscience project data collection. The MIDUS Milwaukee Refresher was conducted by the UWSC and funded by the National Institute on Aging.

In 2013, **MIDUS 3** returned to living longitudinal respondents who had participated in MIDUS 2. Now aged 40 to 94, participants were recruited with a 45-minute telephone interview, and invited to complete a 100-page self-administered questionnaire, and to participate in a 25-minute cognitive interview via telephone. MIDUS 3 was conducted at the UWSC with funding from the National Institute on Aging. Fielding in May, 2013, MIDUS 3 re-interviewed 3,294 respondents. Subsequently, 2,732 returned the mail questionnaire, and 2,693 participated in the cognitive interview.

MIDUS 3 INSTRUMENT DEVELOPMENT

CATI and SAQ Instruments

The UWSC's work on the MIDUS 3 instruments began in 2011 with development of the MIDUS Refresher instruments. For the MIDUS Refresher the initial telephone recruitment interview, self-administered questionnaires and cognitive telephone interviewer were all reviewed in an iterative fashion and updated to reflect current best practices. Strong consideration was given to maintaining comparability with previous MIDUS longitudinal instruments. Changes made for the Refresher included:

- Addition of new questions related to the recent economic recession to gain a better understanding of the health effects of the recession
- Updates to employment questions to better support occupational and industrial coding
- Addition of several limits and validity checks to improve data quality
- Redesign of the questionnaires to more closely conform to current best practices.

Starting with the freshly reviewed and revised MIDUS Refresher instruments, changes made for MIDUS 3 included:

- Addition of respondent verification and a mortality cognitive closeout interview to the initial telephone instrument
- Adjustment of reference periods to account for previously collected information
- Removal of inapplicable baseline questions from the initial telephone interview and questionnaires
- Revision of limits and validity checks to reflect the vastly wider age range for MIDUS 3 sample
- Addition of an abbreviated set of employment questions for some respondents, driven by information respondents had previously provided.

Skip pattern logic was reviewed and instruments thoroughly tested and debugged. The initial telephone instrument was ready for fielding by the end of May, 2013. Questionnaires, created in Microsoft Word, were converted to ready-to-print pdf format by April, 2013. Questionnaires were printed at UW Printing Services.

Cognitive Interview Instrument

In July, 2011, UWSC staff met with Dr. Margie Lachman of Brandeis University and key UW-IOA staff to discuss the Cognitive Interview instrument and protocols in preparation for the MIDUS Refresher. The Cognitive Interview instrument developed for the MIDUS Refresher was also used for MIDUS 3. Instruments and protocols mostly replicated those used during MIDUS 2. However, due to an increasing prevalence of cell telephones, measures were added to account for the variable latency in response due to technology.

Eric White, UWSC Director of Programming, investigated telephone relay lag variance, finding that lag could vary widely even within a call. Dr. Margie Lachman and Dr. Patricia Tun developed the Metronome Count, a method to measure response variance both between and within calls. The Metronome Count protocols were further developed and tested, and the measure was added to the instrument before and after the key task measuring response latencies.

By October, 2011, the Cognitive Interview instrument, including the new relay latency measure, was programmed and tested. Cognitive data collection involved digital recording of the entire interview. A new audio file format was tested to ensure comparability with MIDUS 2 audio files. Audio recordings of mock interviews were reviewed by the client. Time stamps were added to the instrument to support the automation of audio processing and review being conducted at Brandeis University and the instrument was ready for fielding.

In July, 2013, after only minor revisions to the MIDUS Refresher Cognitive Interview instrument, the MIDUS 3 Cognitive Interview instrument was ready for fielding.

Project Management Database

The UWSC created a project management database, connected to the recruitment interview instrument, the UWSC tracing database, and the cognitive interview instrument, that allowed real-time review of progress of each case across all treatments throughout the entire field period. In addition, entries in the project management database initiated the individualized movement of each case through the treatments.

The database stored:

- Current and previous respondent contact information
- Dates of mailings
- Dates of participation
- Interim or final case disposition codes for each treatment
- Key variables from the recruitment and cognitive telephone interviews, including respondent age, gender, and education, call notes, and interviewer observations
- Sample variables such as sample type and replicate number

Customizable queries supported refusal conversion and tracing efforts; reporting of progress by treatment by sample type, age category and gender; generation of address labels for the on-going posting of birthday greetings; and review of Cognitive Interview results.

MIDUS 3 SAMPLE

In the MIDUS 3 study, UWSC sought to re-interview living MIDUS longitudinal sample who had completed the MIDUS 2 telephone interview. Of the 4,963 MIDUS 2 participants, 210 were known to be deceased (via previous National Death Index submissions), and 65 had either withdrawn from the study or been deemed cognitively unable to participate in future efforts.

From March, 2013, through May, 2013, UWSC conducted pre-tracing on the remaining 4,688 potential MIDUS 3 participants, seeking the most current contact information. The pre-tracing sample file included the last known name, address and telephone number for each respondent, the telephone number and address at the time of the MIDUS 2 interview, dates of previous interviews, date of birth and social security number, original sample type, and information linking sibling and twin respondents.

As a result of regular mailings by the UW-IOA to MIDUS participants, respondent addresses had been updated in the nine years since MIDUS 2 had fielded. Nevertheless, UWSC located over 500 new addresses. With no intervening calling efforts, and an increasing move to cellular telephones, the telephone information was expected to be less current. UWSC used a conservative approach during pre-tracing, opting to retain phone numbers unless strong evidence indicated they were not good.

When all 4,688 cases had been reviewed, an additional 220 potential participants were found to be deceased, and 10 deemed ineligible, leaving a sample of 4,458. Once fielding began, two additional ineligible respondents requested to participate and were included in the fielded sample, giving a total MIDUS 3 sample of 4,460 cases.

The sample of 4,460 included respondents who had originally been recruited in one of three ways: 2,423 respondents had been recruited by random digit dialing (RDD), 677 respondents recruited as siblings (SIB) of the RDD sample, and 1,360 respondents recruited in the largest random recruitment of twins anywhere (TWIN). See Table 1.

Table 1: MIDUS 3 Fielded Sample, by Sample Type

Sample Type	Number of Cases Fielded
Random Digit Dial	2423
Sibling	677
Twin	1360
Total	4460

The pre-traced sample was divided up into 46 replicates of approximately 100 cases each. See Table 2. The replicates were not random, but drawn based on original sample type and relationships:

- The initial 20 replicates were drawn from RDD sample who had never had siblings in the study.
- Replicates 21 through 31 were drawn from RDD sample who had ever had siblings in the study and their siblings.
- Replicates 32 through 45 were drawn from the twin sample.
- Replicate 46 was a mixture of sample types, and consisted of 28 suspect cases where no current address or telephone information had been located, or only overseas addresses had been found.

Care was taken to group twins and siblings together in replicates so that family members would be fielded simultaneously.

Table 2: MIDUS 3 Fielded Sample, by Replicate

Replicates	Number of Cases Fielded
Replicate 1 - 3 (RDD)	300
Replicate 4 - 8 (RDD)	500
Replicate 9 - 13 (RDD)	500
Replicate 14 - 19 (RDD)	600
Replicate 20 (RDD)	99
Replicate 21 - 25 (RDD and SIB)	500
Replicate 26 - 31 (RDD and SIB)	583
Replicate 32 - 34 (TWIN)	300
Replicate 35 - 39 (TWIN)	500
Replicate 40 (TWIN)	100
Replicate 31 - 42 (TWIN)	200
Replicate 43 (TWIN)	100
Replicate 44 - 45 (TWIN)	150
Replicate 46 (MIX)	28
Overall	4460

The first replicate was fielded in late May, 2013.

The last replicate fielded in July, 2013.

Sample Input files

The MIDUS 3 sample file included the dates of respondents' previous MIDUS interviews and basic demographic information. This information was used to remind respondents of past participation and helped to verify respondent identity. Some MIDUS 3 questions used the MIDUS 2 participation date to bound the reference period of interest, for example, to ask for changes since the last interview in a specified year.

The MIDUS 2 marital status and respondent and spousal employment status was used in the creation of employment flags that triggered alternate, potentially much-abbreviated, sets of employment questions.

TRACING

Tracing Database

Tracking and Locating staff used the UWSC Tracer to update and track contact information for respondents across protocols. The Tracer retains a record of all past and current addresses, names, and phone numbers. The Tracer system interacted with the recruitment telephone interview instrument, the project management database, and the cognitive interview telephone instrument to ensure the most up-to-date contact information was collected and used as cases flowed through the protocols. All new contact information collected during interviews was imported into the Tracer, then cleaned and traced. Tracking and Locating staff entered the date tracing was conducted, a "tracing code" indicating current status, and individual notes on each case.

MIDUS pre-tracing was not conducted in the Tracer. To ensure this historical information could be returned to the UW-IOA, the original untraced contact information for fielded cases was loaded into the Tracer prior to uploading the updated, pre-traced, contact information.

Tracing Protocols

During the initial and cognitive telephone interviews, cases were sent for tracing when calls resulted in wrong numbers, disconnected numbers, faxes, or when an informant reported a known respondent was no longer living at the number. After 20 calls without contact, cases were sent for tracing. If the Tracking and Locating department could not find a better number, a phone request letter was sent to the respondent, noting the contact information on file and requesting updates. If the respondent did not reply with a better number, the case was put on hold for a month, and retraced. This process was repeated as necessary throughout the field period. If the phone number looked good, a hard-to-contact letter was sent to the respondent, indicating that the UWSC was having difficulty reaching them, and requesting respondents to call in at their convenience to participate. The case was put on hold for a month, and then retraced if the respondent had not yet called.

All undeliverable MIDUS mailings were also sent for tracing. If no better address was identified, up to five phone calls were placed to the respondent in an attempt to collect a new address or to confirm the existing one. Updated address information was entered in the Tracer.

If after multiple rounds of tracing, respondents still could not be located, calls were placed to people respondents had previously indicated would know how to reach them. To avoid respondent

confusion, siblings and twins who were also in the study were not called for information until their participation was complete.

See UWSC Tracing Manual highlighting tracing methods in Appendix C.

FIELD PROCEDURES

A Toll-Free Respondent Line

To maximize opportunities to make contact with respondents, UWSC re-activated the toll-free line dedicated to MIDUS, established during MIDUS 2. The MIDUS line is distinct from the general toll-free numbers in use for other studies conducted by UWSC, and is available only for MIDUS respondents. A voicemail box is set up on this phone number in the event that Call Center staff are not available to answer the phone. A recorded message instructs callers to leave a message if they are calling about an interview, or regarding a payment question. The toll-free number was included in advance letters sent to all MIDUS participants. During the field period, the toll-free number was given out by interviewers trying to reach respondents and left on answering machines to encourage difficult to reach respondents to call in.

Advance Letters

To emphasize the importance of every respondent's participation, one week prior to being contacted by a telephone interviewer each MIDUS respondent was sent a personalized mailing that included a cover letter, a \$2 bill as a pre-incentive, and a MIDUS 3 brochure. The letter explained the purpose of the study and informed respondents that a new wave of MIDUS calling was about to begin. The brochure highlighted the reasons for the study, emphasizing the ongoing importance of MIDUS research and reacquainted respondents with the MIDUS study. It explained that the initial MIDUS 3 interview would take place over the telephone, and that the study would also include a questionnaire, a short cognitive interview, and the potential to participate in other MIDUS research. The respondent's current phone number was prominently displayed atop the letter, and respondents were asked to call the MIDUS toll-free number to update any information or to indicate preferences on the best times to reach them. Both the letter and the brochure included the MIDUS toll-free number. (See Appendix D.)

CATI Autoscheduler

The CATI autoscheduling system allowed anyone accessing a case to read the call notes of all previous attempts to reach the respondent, and administrative notes indicating when a case was sent for tracing, and the results of the tracing effort. The autoscheduler kept track of all sample telephone numbers, automatically routing cases for proper follow-up for the next call attempt or for review, and maintained an elaborate set of management records.

Verifying Identity via Telephone

Information from a respondent's previous MIDUS interviews was displayed on the electronic cover sheet to help interviewers and tracers confirm respondent identity. This information included respondent name, date of birth, approximate age, address during MIDUS 2, previous participation status, and current phone numbers.

A set of questions was programmed into the instrument for interviewers to verify respondent identity, by first confirming birth date or age, and if that verification failed, by confirming a respondent's address during MIDUS 2. If these questions failed to verify that a respondent was the one previously interviewed, the interview was exited. The respondent was told that they would be called back once UWSC verified that we had the correct respondent. This system was most helpful in identifying cases where an incorrect person had been identified as the respondent during tracing. It also helped in situations where family members lived in the same household, such as a junior and a senior with the same name, and ensured UWSC interviewed the correct respondent.

Verifying Identity via Questionnaire

The questionnaire contained a question requesting the respondent's date of birth. While not originally intended to verify respondent identity, the response to this question was compared to the date of birth provided during the initial recruitment telephone interview. Discrepancies identified cases where someone other than the recruited respondent may have completed the questionnaires. Cases with such discrepancies received further review and tracing, including personal calls to the respondent to verify information.

Study Protocols

The MIDUS 3 initial telephone interview, the mail questionnaire, and the cognitive telephone interview were all in the field simultaneously. Cases flowed through the protocols on an individualized timeline. Some respondents completed the mail questionnaire within days of finishing the phone interview, while others took months to complete the mail questionnaires.

MIDUS sent an **initial newsletter** in Spring, 2013 alerting longitudinal participants of the new round of data collection. Thereafter, the basic fielding protocol was as follows.

- 1) An **advance letter** was sent which included a brochure explaining the three portions of study, and a \$2 pre-incentive.
- 2) Cases were **fielded for the initial telephone interview** a week after the advance letter posted.
- 3) A **CATI post-incentive check** for \$25 and a thank you letter was sent to the respondent within a week of completion of the telephone interview.
- 4) An **SAQ packet** was sent to the respondent ten days after the CATI post-incentive was sent. The SAQ packet contained:
 - a. A cover letter explaining how to fill out the SAQ booklets
 - b. Two SAQ booklets
 - c. Two five dollar bills (\$10), pre-incentives to complete the SAQ booklets
 - d. A tape measure, for use in taking requested body measurements
 - e. A large business reply envelope, for returning completed questionnaires
 - f. A letter-sized business reply envelope, for separately returning a removable re-contact sheet requesting contact information of friends or family who might know how to find the respondent in the future.

- 5) An **SAQ reminder postcard** was sent two weeks after the SAQ packet was mailed. It encouraged respondents to complete and return the SAQs as soon as possible.
- 6) *For SAQ non-responders:*
A **second SAQ packet** was sent, similar to the first but without the pre-incentive, 4 weeks after the first SAQ packet postdate. A **second reminder postcard** was sent to non-responders in another 4 weeks that served as advance notice for the Cognitive Interview.
- 7) *For SAQ responders:*
An **SAQ post-incentive** check for \$25 and a thank you note was sent within one week of receipt of the completed SAQ booklets.
- 8) Cases were **fielded for the Cognitive Interview** two weeks after either the SAQ post-incentive OR the second SAQ reminder postcard was sent. No additional incentives were sent for completed Cognitive Interviews.
- 9) At the end of the Cognitive Interview, SAQ non-responders were again prompted to return their questionnaires. A **third SAQ packet** was sent to participants upon request.

Special protocols, used as needed, consisted of:

- 1) An additional copy of the **advance letter** and brochure were sent upon request to respondents who reported they had not received the advance letter.
- 2) A **phone request letter** was sent during the telephone interviews if the telephone number appeared to be bad, or if the respondent never answered. The letter asked respondents to update their contact information if it had changed. The mailing included a form to return with new contact information and also provided the MIDUS toll free number.
- 3) A copy of the **Certificate of Confidentiality**, obtained from the federal government for the MIDUS study, was sent upon request to respondents who expressed concern about confidentiality issues.
- 4) A **hard-to-contact letter** was sent to respondents who did not answer their phone for the initial telephone interview. The letter asked respondents to call the UWSC to schedule an interview or to update contact information if it had changed.
- 5) **Refusal letters** were sent to reluctant respondents, explaining the importance of their participation. Two weeks after this letter was sent, a specially trained refusal converter would attempt to conduct the interview with the respondent. If the respondent again refused, calling was suspended for that respondent.
- 6) When, during the initial interview, an informant reported that a **respondent was deceased**, a **Mortality Cognitive Closeout (MCC) interview** was attempted. The MCC interview collected details about the death and the respondent's cognition prior to death. Informants lacking knowledge about the death were asked for referrals to someone who did know more about the respondent's death. Contact information was collected for return calls. UWSC Tracking and Locating staff attempted to find corroborating evidence of deaths and added death dates to the project management database.

- 7) Respondents expressing other concerns were contacted either by UWSC project director Vicki Lein, or by Dr. Barry Radler, University of Wisconsin IOA.

See Appendix E for examples of mailing materials.

CATI Refusal Protocol

Standard protocol at the UW Survey Center is to hold a case that has refused for at least two weeks before attempting a conversion. This strategy was applied to and expanded upon for MIDUS 3. Cases continued to be called if refusals occurred directly after the phone was answered, before respondents knew the purpose of the call, or if an informant refused on behalf of a respondent with little information about the purpose of the call. When respondents or informants who knew the purpose of the call expressed reluctance to participate, the case was held for at least two weeks, and a letter reminding respondents of their past participation and the importance of the study was sent to encourage participation. Two weeks later, refusal conversion specialists assigned to the case attempted to convert reluctant respondents. If respondents again expressed reluctance to participate, cases were placed on hold. A Call Center shiftleader, trained as a refusal expert, reviewed all such cases. Cases might be finalized, or they might be sent for further treatments. For example, if a respondent refused because they were currently too busy, but they expected to have time in several months, the case might be put on long term hold to be called again in four to six months. Some cases were referred to the project director for possible follow up. The project director called respondents to address specific concerns, sending out the MIDUS Certificate of Confidentiality to respondents with confidentiality concerns, providing references to recent studies that used MIDUS data to respondents who wondered if their participation had value, and reassuring gatekeepers of the study's legitimacy and the respondent's previous participation. Some refusals were referred to Dr. Barry Radler at the University of Wisconsin IOA for further follow-up, such as when respondent concerns related to previous participation in other MIDUS projects. If, after concerns were addressed, a respondent was still reluctant to participate, the case was finalized as a refusal.

Respondent Payments

Respondent payments were discussed in sequence in the field protocol section, but to recap, respondents received a post-incentive check of \$25 after completing the main recruitment telephone interview. They were then sent \$10 (two five dollar bills) in pre-incentive along with the initial mail questionnaire packet. After the completed questionnaires were received, respondents were sent another post-incentive check of \$25. No additional incentive was sent for the cognitive phone interview.

Interviewer Training

New interviewers at the UWSC receive over 20 hours of training. Due to its complexity and importance, all MIDUS interviewers were required to have had at least three months experience calling other CATI projects at the UWSC prior to being trained on MIDUS. In a few cases, interviewers showing above average proficiency and maturity were hand-selected for MIDUS training prior to the three month mark.

In addition to the general training and previous experience, MIDUS interviewers received 4 hours of training specific to MIDUS issues and the MIDUS instrument. Interviewers were trained on how cases

would be fielded, how to verify respondent identity using information preloaded into the instrument, and how to conduct mortality closeout interviews if respondents were discovered to be deceased. They learned about MIDUS 3 calling protocols for refusals, and received focused training on industry and occupational items. As MIDUS 3 sample ranged from age 40 to age 94, interviewers were trained in interviewing older respondents, including how to conduct effective interviews in the face of respondent illness and mental or physical challenges related to aging. Interviewers completed a “walk-through” of the entire telephone instrument and participated in demonstrations of industry and occupational probing.

Dr. Barry Radler attended interviewer trainings, presenting on the importance of MIDUS, the purpose and design of the study, results from previous waves of data collection, and goals of MIDUS 3. Dr. Radler shared information about other MIDUS projects, to ground interviewers in the entire MIDUS study, to help interviewers understand how their work fit into the whole, and to prepare them for questions from longitudinal respondents who may have participated in these projects in past rounds of data collection. Dr. Radler’s presentations inspired interviewers, providing background information that helped interviewers inform and persuade potential MIDUS respondents.

After the training, interviewers were given time to practice on their own, pairing up to practice industry and occupation probing, and then completing at least two practice cases in their entirety before calling potential respondents.

After the training, interviewers were given time to practice on their own, pairing up to practice industry and occupation probing, and then, if they had not previously been a MIDUS Refresher interviewer, completing at least two practice cases in their entirety before calling MIDUS 3 sample.

In addition to project-specific training, all UWSC interviewers are regularly monitored during calls to respondents to ensure that they are following protocol and adhering to standardized interviewing techniques. UWSC uses a blind monitoring system, where a supervisor sits in a room not visible to the interviewer, and uses a monitoring system that allows them to hear interviews (both the respondent and the interviewer), see the same screens the interviewer is seeing during the interview, and see the answers that the interviewer enters as they are being entered. All interviewers have their work monitored on a monthly basis, and are provided feedback critiquing their work and offering suggestions for improvement. If there are special issues that require attention, interviewers are monitored more frequently. This system of monitoring interviewers allows for constant improvement of staff abilities. If there is a larger training issue that all interviewers would benefit from learning about, monitoring makes the issue apparent very quickly.

Cognitive Interviewer Training

Highly-specialized interviewer training was required for the Cognitive interview. Tasks involved in cognitive interviewing differ from the usual tasks in telephone interviews. Rather than obtaining factual information from the respondent or asking respondent opinions, the MIDUS Cognitive interview involved administering cognitive tests to the respondents on the telephone. Some of these tests were timed, and so included a speed element. Other tests involved collection of open-ended responses from the respondent in a timed fashion, which made it difficult for the interviewer to record using standard data entry methods. One of the tests involved a task-switching element for respondents which required the interviewer say things with very precise timing while recording respondent answers at the same time.

Interviewers were specifically selected to train for the Cognitive Interview. As a prerequisite, they had to have trained for the MIDUS recruitment telephone interviewer and to have successfully called on MIDUS for over a month. Cognitive interviewers had to attend trainings during non-standard work hours. Trainings took place in the UWSC Call Center, and thus usually were scheduled when the Call Center was closed.

The Cognitive interviewer training differed from other UWSC training sessions in that it is a hands-on training. Each task was explained, interviewers had a chance to administer the task, and then the task was discussed. Interviewers were given detailed instructions, including the tone of voice and inflection to use in administering each task, acceptable words to use between tasks, how to test and use programmed timers and audio recording equipment, how to respond to respondent 'errors' and self-corrections, how to judge when a task was too difficult for the respondent and how to graciously exit such a task. Interviewers were given individual feedback during the training session on how to improve technique.

After the training, interviewers were paired up and asked to practice for at least four hours. When they were ready, they were tested on a specially programmed module, a stand-alone version of the "Red/Green" task-switching test. Interviewers were tested under three different scenarios: one with a respondent who had no trouble completing the interview, another where the respondent had some difficulties, and a third where the respondent had a great deal of trouble completing the task. Interviewers were tested on these three scenarios to ensure they could competently administer the test with all types of respondents. Only interviewers who obtained a 95% accuracy rate on all three scenarios were approved to start conducting cognitive interviews.

Audio recordings of the entire interview were delivered to Brandeis daily. In addition to the real-time live monitoring of the Cognitive interviews done by UWSC, staff at Brandeis also reviewed the audio recordings and provided specific feedback to individual interviewers.

See Appendix E for interviewer training materials

Data Entry Protocol and Staff Training

Double data entry for the MIDUS questionnaire began in October, 2013. The two SAQ booklets that make up the MIDUS 3 questionnaire were 45 and 55 pages in length respectively. They include every possible type of formatted question, making them quite complex to enter. Given all of these facts, each booklet was first reviewed by an "editor" to uncover any issues that could cause data entry confusion. Editors resolved issues before questionnaires moved on for data entry. All data entry operators were eligible to become editors if they passed the certification process. Editor protocols were included in the Data Entry Specifications Manual. Editors were trained on how to resolve the most common problems, such as respondents who gave multiple answers, selected answers that fell between actual response categories, or followed skip patterns incorrectly.

Data entry staff were given two hours of MIDUS-specific training to familiarize them with the instrument, train them in the specific protocols set for the project, and give them an opportunity to practice and ask questions about the data entry process. (See Data Entry Specifications Manual in Appendix F.) Each questionnaire booklet was double-data entered, blind entered by two different data entry staff members. When a discrepancy between the first pass and the second was found by the CASES system, the second data entry person was alerted to the difference in responses, determined the correct answer (with help from an editor if needed) and made the appropriate corrections.

EFFORT REQUIRED

Recruitment Interview Call Attempts

Overall, UWSC placed 57,648 telephone calls on 4,460 cases during the MIDUS 3 telephone interview. The number of call attempts per case ranged from 0 (cases with no working telephone number) to 95, with an average of 13 call attempts per case overall - 8 call attempts for cases with completed interviews, and 27 call attempts for cases without a completed interview. Call attempts included calls to numbers that were later found to be inaccurate. Some respondents had provided multiple numbers; if no one answered at the home number, subsequent numbers were called until a message could be left or the numbers were called through. See Table 3 for details of calling efforts and results.

Table 3: MIDUS 3 CATI Interview, Call Attempts

Number of Call Attempts	Number of Completes	Percent of Completes	Cumulative Percent of Completes
1-2 calls	1030	31%	31%
3-5 calls	925	28%	59%
6-10 calls	615	18%	78%
11-20 calls	406	12%	90%
21-30 calls	169	5%	95%
30+ calls	149	5%	100%
All calls	3294	100%	

Of the 4,460 MIDUS 3 longitudinal cases, 569 had refused at some point during the recruitment interview, either by a respondent themselves or an informant. UWSC interviewers successfully converted 147 of these refusals (26%) into completed interviews.

Mailings

UWSC sent 20,000 pieces of mail over the course of the MIDUS 3 field period, including 4,568 advance letters, 6,012 post-incentive checks, 4,338 questionnaire packets, and 2,875 reminder cards. See Table 4. Undeliverable items were resent whenever better address information was located. All mailings were resent upon request.

Table 4: MIDUS 3 Mailings

Mailing Type	Number Sent
CATI advance letter	4568
Phone request letters	763
Hard-to-contact letters	1152
Tracing postcards	292
CATI post-incentive*	3295
SAQ, first packet with pre-incentive*	3295
SAQ, reminder postcard	2103
SAQ, second packet, to non-responders	963
SAQ, second reminder to non-responders	772
SAQ, third packet, after COG	80
SAQ post-incentive	2717
TOTAL Mailings	20000

*Includes 1 sent to respondents later deemed ineligible

Cognitive Interview Call Attempts

Out of the 3,294 participants recruited via the MIDUS 3 initial telephone interview, 3,286 were invited to complete a Cognitive Interview. See Table 5. The non-fielded cases were ineligible or had withdrawn from the study prior to the Cognitive Interview.

Table 5: MIDUS 3 Cognitive Interview Sample

Potential Sample	Ineligible or Withdrawn From Study	Actual Sample
3294	8	3286

During the MIDUS 3 Cognitive Interview, the UWSC placed 33,782 telephone calls on 3,286 cases. The number of call attempts per case ranged from 0 (cases lacking any valid telephone number) to 75, with an average of 10 call attempts overall, and an average of 7 call attempts among cases with a completed interview. See Table 6 for details of cognitive calling efforts and results.

Table 6: MIDUS 3 Cognitive Interview, Call Attempts

Number of Call Attempts	Completes and Usable Partial	Percent of total	Cumulative Percentage
1-2 calls	934	35%	35%
3-5 calls	790	29%	64%
6-10 calls	446	17%	81%
11-15 calls	204	8%	89%
16-20 calls	134	5%	94%
21+ calls	185	7%	100%
All calls	2693	100%	

Of the 3,286 MIDUS 3 cases fielded for a Cognitive Interview, 278 had at some point been refused by a respondent or informant. UWSC interviewers successfully converted 79 of these refusals (28%) into completed cognitive interviews, and another 4 were finalized as usable partials (1%).

RESULTS

See Appendix B for a more detailed presentation of response.

MIDUS 3 CATI Recruitment

UWSC interviewers successfully recruited 3,294 longitudinal participants into the third round of the MIDUS longitudinal study via the initial MIDUS telephone interview. See Table 7.

Table 7: MIDUS 3 CATI Case Disposition by Sample Type

Case Disposition	RDD	SIB	TWIN	Total
Completed interview	1730	544	1020	3294
Mortality closeout interview	14	7	12	33
Refusal, respondent or informant	188	40	113	341
Withdrew from study	8	1	3	12
Respondent never available	232	45	109	386
Respondent not located	167	17	64	248
Deceased	23	6	11	40
Unable, physically or cognitively	54	16	25	95
Ineligible, live outside USA	7	1	3	11
Total	2423	677	1360	4460

In the response rates calculated in Table 8, below, respondents who were deceased, living outside the USA, or physically or cognitively unable to participate were counted ineligible, and removed from the denominator.

Table 8: MIDUS 3 CATI Response Rate by Sample Type

Status	RDD	SIB	TWIN	Total
Completed interviews	1730	544	1020	3294
Sample fielded	2423	677	1360	4460
- Ineligible, deceased or unable	98	30	51	179
Eligible sample	2325	647	1309	4281
CATI Response Rate (Completes / Eligible Sample)	74.4%	84.1%	77.9%	76.9%

MIDUS 3 Questionnaires

All recruited participants who completed the initial telephone interview were invited to complete the SAQs. All phone respondents were invited to participate in the cognitive interview via telephone, whether they completed the SAQ or not.

Out of 3,295 participants sent a MIDUS 3 questionnaire, 2,732 respondents returned it with at least some portion completed. See Table 9.

Table 9: MIDUS 3 SAQ Results by Sample Type

Case Disposition	RDD	SIB	TWIN	Total
Completed questionnaires	1427	473	832	2732
Refusal	5	2	1	8
Withdrew from study	5	1	3	9
Nothing returned	286	67	181	534
Deceased	2		1	3
Unable, physically or cognitively	5	1	2	8
Ineligible, live outside USA	1			1
Total	1731	544	1020	3295

In the response rates calculated in Table 10, below, respondents who were deceased, living outside the USA, or physically or cognitively unable to participate were counted ineligible, and removed from the denominator.

Table 10: MIDUS 3 SAQ Response Rate by Sample Type

Status	RDD	SIB	TWIN	Total
Completed questionnaires	1427	473	832	2732
Sample fielded	1731	544	1020	3295
- Ineligible, deceased or unable	8	1	3	12
Eligible sample	1723	543	1017	3283
SAQ Response Rate (Completes / Eligible Sample)	82.8%	87.1%	81.8%	83.2%
Compounded Response Rate (CATI RR * SAQ RR)	61.6%	73.3%	63.7%	64.0%

MIDUS 3 Cognitive Interview

Out of 3,286 cases fielded, 2,693 participated in the cognitive interview, 2,680 completed interviews, and 13 had usable partial interviews. See Table 11.

Table 11: MIDUS 3 COG Results by Sample Type

Case Disposition	RDD	SIB	TWIN	Total
Completed interview	1402	467	811	2680

Usable partial interview	9	1	3	13
Refusal, respondent or informant	96	24	70	190
Withdrew from study	5		4	9
Respondent never available	178	45	115	338
Respondent not located	11	2	4	17

COG Response Rate (Completes / Eligible Sample)	83.0%	86.8%	80.8%	82.9%
Compounded Response Rate (CATI RR * COG RR)	61.7%	73.0%	63.0%	63.8%

*Includes 7 cases deemed ineligible prior to fielding

INTERIM AND FINAL DATA DELIVERIES

Delivery of Contact Information

UWSC staff worked with UW-IOA staff to modify the delivery database, known as the “Shell”. Contact information from the UWSC Tracer system, and information collected during the recruitment telephone interview and the cognitive telephone interview all fed into the Shell. The Shell included respondent contact information, demographic variables, interviewer assessments, call notes, and mailing and completion dates. UWSC monitored progress, identified eligible participants, and populated the Shell and delivered it to the UW-IOA as needed throughout the field period.

The Shell included:

- Contact information – Names, addresses, phone numbers, and previous contact information for each respondent.
- Call notes – Interviewer record of the outcome of each call attempt, giving possible insights into how to best re-contact respondents.
- Interviewer Assessments - After the initial interview and the cognitive interview, interviewers rated respondent cooperativeness and competency and recorded anecdotal information respondents may have shared that might help future recruitment efforts.
- Dates – Field dates were recorded, including the initial interview completion date, questionnaires mailing and completion dates, and the cognitive interview completion date.

The UWSC delivered one comprehensive installment of the Shell which included all cases, delivered on June 3, 2015.

Delivery of CATI Data

On June 5, 2013, within one week of fielding the initial MIDUS 3 telephone interview, UWSC delivered for UW-IOA review an interim data set of the first 38 completed interviews. UW-IOA staff reviewed recruitment data cleaning scripts and confirmed that all data was being collected in the desired format. By

June 14, 2013, two weeks after calling began, interim data for 329 completed recruitment interviews was delivered. No issues were identified as needing further attention.

Final telephone interview data on 3,294 cases was delivered in August, 2014. The delivery included data from 3,294 interviews conducted from May, 2013 through June, 2014.

Delivery of Industry and Occupation (IO) Codes

In a series of open-ended questions in the MIDUS 3 telephone interview, the UWSC collected employment information for the respondent and their spouse or partner. Collected information was exported verbatim into the UWSC coding database, a system used by trained coders to convert open-ended response into job titles and industry codes.

UWSC coders are trained to use hard-copies of the Alphabetic Index of Industries and Occupations, the Alphabetic Index of Military Occupations, and the Production Coder Manual published by the Bureau of the Census, but the majority of coding is done using software developed by UWSC staff. The software searches a database of occupation and industry titles and returns all titles that match the search parameters. The resulting titles and codes are sorted by group and displayed in a hierarchical list, allowing coders to quickly review all variations on a given title. The software records the codes and titles assigned to each response, along with a detailed history of coder searches.

MIDUS coders work in pairs, double-coding each case. Supervisors review all codes that do not agree, and later meet with individual coders to review discrepancies. MIDUS coded to the 2010 Alphabetic Index of Industries and Occupations distributed by the US Census Bureau. Codes assigned with the Alphabetic Index were then converted to their SOC and NAICS counterparts.

All IO codes were delivered in September, 2014. Coded variables included industry and occupation for jobs reported by the respondent for their own current or former occupation, and for the current occupation of the respondents' spouse.

Delivery of SAQ Data

In November, 2013, UWSC delivered an interim data set of the first 100 completed MIDUS 3 questionnaires data entered. IOA staff reviewed the SAQ data cleaning scripts, slightly revised data entry specifications affecting interviewer notes, and approved continuing data entry.

MIDUS 3 SAQ final data was delivered in December, 2014, and include 2,732 cases.

Delivery of Cognitive Interview Data

An additional data delivery that took place involved the Cognitive interview. MIDUS 3 Cognitive Interview interim data was delivered to researchers at Brandeis regularly throughout the field period. Data deliveries usually occurred biweekly, and consisted of a data file, open ended response, and interviewer notes. MIDUS 3 Cognitive Interview data interim deliveries ran from July, 2013 through October, 2014.

In addition to the data itself, full audio recordings of cognitive interviews were delivered daily via a secure shared drive. Five key demographic variables were delivered regularly for all completed interviews, in addition to interviewer notes on respondent cooperativeness, and interviewer assessments of respondent physical or mental health issues that may have made the interview difficult for the respondent. This information was used by Brandeis to begin scoring the tasks conducted in the interview and to assess the quality of the data.

MIDUS 3 Cognitive interview final data was delivered on October 30, 2014, and included 2,680 completed and 13 usable partial interviews.

NOTE:

All Appendices are available upon request from the MIDUS Administrative Core. Please contact midus_help@aging.wisc.edu.

Sample Description and Response Rate Report MIDUS Milwaukee 2 (P1170) December 2017

Overview

The Midlife in the U.S. (MIDUS) is a national longitudinal study that investigates how the health and well-being of Americans is affected by work, relationships, health, economic turmoil, and personal outlooks, and to understand the factors that best protect health from midlife into old age.

Questions in this round of MIDUS will also help researchers better understand the health effects of the recent recession and how they may vary by age group.

The MIDUS Milwaukee Study II (referred to internally as MKE-2) was conducted by the University of Wisconsin Survey Center (UWSC) for Drs. Carol Ryff and Barry Radler at the University of Wisconsin Institute on Aging, and Dr. David Williams at the Harvard School of Public Health.

The overall purpose of the MMKE-2 was to follow-up with the African-American oversample respondents who were interviewed in 2005 to see how their lives have changed in 11 years. MIDUS Milwaukee Study II was the first follow-up survey interview with the Milwaukee African-Americans since these respondents initially joined the study in 2005. Some portions of the MMKE-2 interview were very similar to the 2005 interview, while other survey items were new or different. Like the 2005 interview, this follow-up interview was conducted as a computer-assisted personal interview (CAPI) in the respondent's home or a nearby neutral location such as a library study room. Telephone interviews were attempted with respondents who were no longer living in Wisconsin or in bordering states.

At the conclusion of the CAPI interview, field interviewers handed off a self-administered questionnaire (SAQ) for the respondent to complete at their convenience. After completing the SAQ, UWSC called respondents to ask them to complete a telephone interview (internally referred to as the Cognitive interview or the Telephone Assisted Cognitive Testing (TACT) interview).

University of Wisconsin Survey Center

Founded in 1987, the University of Wisconsin Survey Center (UWSC) serves the survey research needs of a wide variety of clients including faculty, staff, and administration at the University of Wisconsin; faculty and staff at other universities; federal, state, and local governmental agencies; and not-for-profit organizations. A department in the College of Letters and Science of the University of Wisconsin—Madison, the UWSC provides a complete range of survey research capabilities. The mission of the Survey Center is to assist researchers by providing the highest quality survey research services.

Professor Nora Cate Schaeffer is the Faculty Director of the UWSC, and John Stevenson is the Associate Director. Eric White, Augie Salick, Kate Krueger, Brendan Day, and Chris Schlapper were involved in instrument and CAPI tools programming. Kerryann DiLoreto was the Lead Project Director, alongside Project Directors Vicki Lein, Karen Zoladz, and Griselle Sanchez.

Instruments

CAPI Interview

The CAPI interview for this project was conducted using a computer-assisted personal interviewing system (CAPI). The CAPI software employed by the UWSC is CASES 5.5 provided by the Computer-Assisted Survey Methods Program at the University of California-Berkeley.

The CASES program provides a comprehensive range of computer assisted interviewing tools. As a fully-featured CATI package, CASES has all the programs necessary to install sample (including importing pre-existing data into the sample records), prepare a data collection instrument, monitor survey progress, automatically send into the field those cases that require calling at a specific time or date (i.e. automatic call scheduling), code and clean data, produce reports, and output data into rectangular files for analysis.

Using the CASES program, the text of the survey appears question by question on a computer screen for the interviewer to read to the respondent. Routing through the interview is based on skip logic pre-programmed into the computer. Question wording may be adapted according to answers given previously in the interview. The system allows for pre-coded questions, open-ended questions, and combinations of the two. In addition, the computer allows only valid responses to be entered; when an invalid response is entered, the computer asks the interviewer to reenter the response.

The CAPI instrument consisted of questions about recession experience, health, education, occupation and industry, marriage; health insurance, finances, social networks, parents' health, children and household members, caregiving, living arrangements, community involvement, race and ethnicity, discrimination, life satisfaction, and contact information of family and friends to help us contact the participant in the future. The CAPI instrument also included hip and waist measurements and a section for interviewer observations. Showcards were used for items with long or complicated answer options.

A special feature of this study instrument was a section of questions administered via ACASI (Audio in Computer-Assisted Self-Interview). These sensitive questions on discrimination were pre-recorded in a female voice and then loaded into the instrument as .wav files. These files played through headphones attached to the laptop as respondents entered their answers on the keyboard. Respondents had the option of turning off the audio for the answer text, however the question text remained on at all times. Audio for the answer text could be turned on or off at each item. The on / off audio settings were logged by the CASES program.

UWSC documented changes to the instrument in a Word document and in an Excel sheet by variable name that was delivered to MIDUS with the final data delivery.

Extensive in-house testing and debugging was done of the CAPI instrument but there was no formal pretest.

The average length of the interview was 153 minutes, with a mode of 142 minutes. (Note: this average was calculated from timers in the instrument. It is the amount of time interviewers spent in the interview instrument itself, but not total time spent with the respondent from start to finish. This average includes situations where the interviewer was in the instrument during the consent process. Also, this average includes situations where the interviewer might have encountered a technical problem while in the instrument. As a result, this average may be considered slightly inflated. This mean and mode does not include the partial interviews.)

Self-Administered Questionnaire

A 44-page Self-Administered Questionnaire (SAQ) was fielded in this study using the 2005 MIDUS Milwaukee Refresher Oversample SAQ as a starting point. The only major change implemented was the replacement of Section D: Childhood, with a new Section D: Childhood and Race. In addition, some minor wording changes were made in Section F: Social Networks to update the types of social media listed in a couple questions.

Cognitive Telephone Interview

The Cognitive Telephone Interview or the Telephone Assisted Cognitive Testing (TACT) interview for this project was conducted using a computer-assisted telephone interviewing system (CATI). The CATI software employed by the UWSC is CASES 5.5 provided by the Computer-Assisted Survey Methods Program at the University of California-Berkeley.

To the extent possible, the instruments and protocols for MKE2 replicated those used during MIDUS MKE1. However, in response to the increasing prevalence of cellular telephones over the years, MKE2 added a method to measure latency due to technology. The Metronome Count, developed and used first during the MIDUS Refresher, was conducted before and after the Red/Green Task, to account for response variance due to technology, both between and within calls.

By June, 2016, the Cognitive Interview instrument was programmed and both the instrument and the digital audio recording of the Cognitive Interview were tested. The Cognitive Interview was fielded in July 2016.

For additional information about the Cognitive Telephone Interview, please see a separate report prepared by Vicki Lein dated July 2017.

Sample Description

The production sample included all respondents who completed the baseline interview in 2005, except for those determined to be deceased during the intervening years. A total of N=518 were fielded in this effort. The sample was provided by the MIDUS client and imported into UWSC databases.

All cases were fielded all at once. Each case was assigned a priority score from 1 to 3 with 1 being the highest priority. This score was determined by the client with priority 1 cases having provided the most amount of data in the initial 2005 UWSC effort (Project 1) and subsequent MIDUS projects such as the daily diary study and biological collections.

Tracing

UWSC created an Access database, referred to as the Project Operations Database (POD), to store respondent contact information. This database was used by UWSC Tracking and Locating staff to update contact information for respondents as needed. The database had the ability to add new telephone or address information while at the same time keeping a record of old information.

Prior to mailing the advance letter to respondents, all cases were traced for updated contact information. If an advance letter was returned to UWSC, the database was updated with this information and the respondent was traced again.

During the CAPI Phase

If it was determined by the field interviewer that an address or telephone number was no longer good, the database was updated and the respondent was traced for new information.

In addition, if a field interviewer was told by an informant that the respondent was deceased or incarcerated, the respondent would be traced to attempt to confirm this information.

During the SAQ Phase

Tracing commenced for MKE-2 when SAQ booklets were returned to UWSC as undeliverable. The Project Operations Database was then updated with any new information, including address and phone number.

During the SAQ and Cognitive interview phases, the tracing department also handled cases where the incentive checks for completing were returned undeliverable. The respondent was traced for new contact information so that the check could be resent.

During the Cognitive Interviewing Phase

During the Cognitive Interview, cases were sent for tracing when numbers were bad or when informants reported respondents no longer lived at the number. After 15 calls without contact, all cases were sent for tracing. If the Tracking and Locating Department found better information, the case was sent for further calling. If no better information was found, staff reviewed notes from the in-home interviewer for better phone information. If new numbers were not identified, the case was held and retraced again.

Study Design and Field Procedures and Protocols

Interviewing for MKE-2 occurred from to June 11, 2016 – January 21, 2017.

UWSC employed 10 field interviewers. All 518 cases were fielded at the same time in an effort to maximize efficiency and increase the time available for multiple contacts on each case.

One important component of this round of interviews was to prioritize interviewing respondents who had participated in one or more MIDUS Projects 2-5. The scores ranged from 1 to 3, with 1 being the highest priority cases. While interviewers were trained to work all cases from the start of the field period, they were able to use this score to prioritize contact attempts and effort applied to cases.

For respondents who lived outside of the Wisconsin area, the interview was completed by telephone. For these telephone interviews, UWSC sent a physical copy of the showcards and a tape measure for the hip and waist measurements to the respondent prior to the interview.

Field Phase 1: CAPI Interview

Respondents were sent an advance letter to introduce this round of the study and inform respondents that interviewers would be contacting them shortly. Interviewers attempted to contact respondents to schedule and conduct the interview in-person. Interviewers called respondents, and as needed, made doorstep visits to respondents, sent text messages and email messages to respondents, called informants, and made doorstep visits to informants. At the end of the CAPI interview, the interviewer gave the respondent a \$50 cash incentive and the 44-page self-administered questionnaire (SAQ) with a postage-paid return envelope.

Field Phase 2: Reminder Call for SAQ

About 34 days after the CAPI interview was completed, reminder calls were made to respondents who did not return their completed SAQ. During these reminder calls, the interviewer encouraged the respondent to complete the SAQ and could also initiate a re-send of the SAQ booklet, return envelope, or both, if needed.

Field Phase 3: Return Visit for SAQ and Cognitive Interview

About 50 days after the CAPI interview was completed, Doorstep visits were made to respondents who did not return their completed SAQ, regardless of whether we reached the respondent for a reminder call. At this visit, interviewers offered assistance to complete the SAQ. They also invited respondents to complete the Cognitive Telephone Interview on the spot, or to schedule an appointment for the Cognitive Telephone Interview. If the SAQ or Cognitive Interview was completed on the spot, the interviewer gave the respondent their incentives in cash (\$25 for a completed SAQ and \$25 for completing the Cognitive interview).

Cognitive Telephone Interview

As soon as the SAQ was completed, the case flowed to the Cognitive Telephone Interview conducted by the UWSC CATI Lab, unless this interview was completed on the spot during a Return Visit.

Advance Letters

To introduce respondents to this round of the study, advance letters were mailed to all respondents approximately three days prior to the start of field period. In this way, interviewers were not doing “cold-calls” to respondents.

The letter itself was personalized, described the MIDUS study and explained that an interviewer would be contacting them shortly about an in-person interview.

Sequencing

Like the MIDUS Milwaukee Refresher effort, the MKE-2 effort was complicated to field due to the fact that each case followed a unique trajectory or timeline, anchored by the CAPI complete date. About a month into the field period, UWSC was managing CAPI interviews, mail surveys, and cognitive telephone interviews concurrently. Some respondents went on to complete their mail survey within days of finishing the CAPI interview, while others took weeks to complete it. This delayed their fielding into the Cognitive telephone effort by as many weeks. The basic sequence of data collection is as follows:

- 1). A respondent was sent an advance letter telling them about the MIDUS Milwaukee study and that they would receive a call from an interviewer to schedule an interview.
- 2). After attempting to reach the respondent by phone three times, the field interviewer made doorstep visits alternating with email and text messages when available, while still continuing to try to reach the respondent by phone. The interviewer also tried to reach informants who might know how to get in touch with respondents.
- 3). When the CAPI interview was completed, the interviewer presented the respondent with a sealed envelope containing \$50 in cash. The respondent opened the envelope in the interviewer’s presence to confirm the amount and signed to acknowledge receipt of the cash.
- 4). Once the respondent received the cash incentive, the interviewer handed over a 44-page SAQ booklet, a letter explaining how to fill it out, and a postage-paid stamped envelope for the respondent to send the completed survey back in.
- 5). When the respondent sent back their completed SAQ, they were mailed a check for \$25 within one week.
- 6). Approximately one week after the payment for the mail survey was sent, cases were fielded for the Cognitive telephone survey.
- 7). An additional \$25 check was mailed to the respondent within one week of completing the Cognitive survey.
- 8). One week after the first SAQ survey was handed-over to the respondent, a postcard was sent to encourage the respondent to fill it out and send it back.
- 9). If a respondent did not return the first SAQ within 3 weeks of receiving it, a second SAQ was sent, with all the same materials as the first booklet but with a shorter, more direct cover letter.
- 10). If a respondent had not returned their completed SAQ within 2 weeks of the second booklet mailing, they were put into the Reminder Call effort, where a CAPI interviewer would call the respondent to encourage them to complete the SAQ. In most cases, the same CAPI interviewer who completed the CAPI interview with this

respondent would make the reminder call. The interviewer could also flag an SAQ or return envelope to be mailed to the respondent if the respondent was missing one or both of these items. The interviewer would attempt to reach the respondent for a reminder call over the course of 12 days.

11). Whether or not the interviewer reached the respondent for the Reminder Call, 4 weeks after the second booklet mailing, the case was put into the Revisit effort, where a CAPI interviewer would make a doorstep visit to the respondent's home to inquire about the SAQ. If needed, the CAPI interviewer could supply the respondent with a third copy of the booklet, take and mail back a completed SAQ, or assist in the completion of the SAQ. If the interviewer received a completed booklet during the course of their visit, they were able to hand over the \$25 incentive in cash. In addition, the interviewer attempted to facilitate the telephone cognitive survey by calling the UWSC CATI Lab and to prepare a specially-trained CATI interviewer to conduct the interview. If the cognitive interview was completed during this visit, the CAPI interviewer was able to hand over an additional \$25 incentive in cash.

12). Once the Revisit field effort ended, any respondent who had not yet returned their completed SAQ flowed to the Cognitive telephone interview effort.

13). If the respondent had not returned their completed SAQ by the time they completed the cognitive instrument they were reminded to complete it and a fourth SAQ was sent to all respondents who had not returned a completed SAQ.

Non-Response and Refusal Protocol

To enhance study recall and to address possible concerns about legitimacy, interviewers attempted to leave their business card and/or a goodie-bag with non-responsive or reluctant households. The goodie-bag contained the MIDUS Milwaukee brochure, a "Sorry I missed you..." note, and a pack of LifeSavers. If the non-response or reluctance continued, the case was given a "cooling off" period of at least two weeks. Eventually, a CAPI Supervisor would re-assign the case to a different CAPI interviewer. Some attention was paid to re-assigning the case to an interviewer of different race or gender.

SAQ Refusal at the end of the CAPI interview

If the respondent refused the SAQ during the handover at the end of the CAPI interview, the interviewer coded a flag variable 2114 SAQ ONLY REFUSAL to synch to the mail database. The case was then pushed to phase 3, skipping phase 2. Thus, the protocol was as follows:

- These cases **DID NOT** receive the SAQ2 or Reminder Postcard mailings.
- These cases **DID NOT** receive the reminder call.
- These cases **DID** receive the return visit.
- These cases **DID** receive the SAQ reminder in Cog if otherwise eligible.
- These cases **DID** receive the SAQ4 mailing.

SAQ Refusal during the Reminder Call

If the respondent refused to complete the SAQ during the reminder call, the interviewer coded a flag variable 2114 to synch to the mail database. The case was then pushed to phase 4, skipping phase 3. Thus, the protocol was as follows:

- These cases **DID NOT** receive the return visit.
- These cases **DID** receive the SAQ reminder in Cog if otherwise eligible.

- These cases **DID** receive the SAQ4 mailing.

SAQ Refusal during the Return Visit

If the respondent refused to complete the SAQ during the return visit, the interviewer coded a flag variable 2114 SAQ ONLY REFUSAL to synch to the mail database. Thus, the protocol was as follows:

- These cases **DID** receive the SAQ reminder in Cog if otherwise eligible.
- These cases **DID** receive the SAQ4 mailing.

SAQ Refusal during Cog Interview

If during the SAQ reminder in the Cog interview, the respondent refused the SAQ, the interviewer coded a flag variable 2112 KNOWN RESPONDENT REFUSAL to synch to the mail database.

- These cases **DID** receive the SAQ4 mailing.

SAQ Refusal as a Mail Return

If the respondent returned an SAQ in the mail as a refusal (including explicit refusals and blank returns), the UWSC mail and data entry department coded as a refusal. Thus, the protocol was as follows:

- These cases **DID NOT** receive the SAQ2 or Reminder Postcard mailings, if still eligible.
- These cases **DID NOT** receive the reminder call, if still eligible.
- These cases **DID** receive the return visit.
- These cases **DID** receive the SAQ reminder in Cog if otherwise eligible.
- These cases **DID NOT** receive the SAQ4 mailing.

SAQ 4

At the end of the Cognitive interview, the SAQ reminder question allowed the interviewer to trigger an SAQ re-send if the respondent did not express any objections or concerns. This constituted the SAQ4 mailing for those who completed the Cognitive interview and did not object to receiving another copy of the SAQ. Other cases received the SAQ4 mailing according to the protocols described above.

Respondent Incentives

Respondents received an arrival gift when their field interviewer prior to the start of the CAPI interview. This arrival gift was a ceramic large handle coffee mug with the MIDUS logo in a box inside a small MIDUS logo tote. Respondents then received \$50 in cash after completing the CAPI interview. They were then mailed a \$25 check after UWSC received their completed SAQ. Once the Cognitive telephone interview was completed, UWSC mailed an additional \$25 check. The check mailed following the SAQ and Cognitive interview provided the MIDUS Milwaukee toll-free number so that respondents could call if they did not have the ability to cash the check. In those instances, UWSC worked to issue them a USPS money order to be cashed at any USPS location with no fee.

If the SAQ and/or Cognitive telephone interview were completed during a Return Visit, the CAPI interviewer handed over the incentives in cash, on the spot.

In addition to the cash incentives, respondents were given a set of earbuds to use during the ACASI module and to keep as thank you. The earbuds came in a clear plastic case that had the MIDUS logo printed on it along with MIDUS Milwaukee toll-free phone number.

CAPI Interviewer Training

UWSC drew from an existing pool of CAPI interviewers who had worked on previous projects to fill five of the ten interviewer slots for the MIDUS Milwaukee project. The remaining five slots were filled with new hires that had other previous interviewing experience.

Interviewers received 40 hours of training that included basic standards and procedures, field logistics, specific MIDUS issues, and MIDUS Milwaukee instrument training. Interviewers learned how cases would be fielded, how to contact respondents, how to take physical measurements for the health module of the instrument, fieldwork guidelines, and protocol for refusals. They also completed a “start-to-finish certification” of the main CAPI instrument during which they demonstrated mastery of basic interviewing skills, as well as mastery of the MIDUS Milwaukee protocols. Interviewers were given time to practice the interview on their own, and were instructed to complete practice cases before they began to visit actual respondents.

The main CAPI interviewer training for MIDUS Milwaukee took place at UW-Madison’s Pyle Center from June 6 to June 10, 2016. Dr. Barry Radler attended a session of the training, and was helpful in motivating the interviewers and providing them with sufficient background information and talking points for persuading participants. He talked about the previous wave of data collection, the purpose and design of the study, and the goals for the Milwaukee follow-up effort in particular. Dr. Radler also shared information about MIDUS projects 2-5 to help interviewers understand the full MIDUS study and how the portion they would be working on fit in.

On July 12, 2016, UWSC hosted a 2-hour webinar for all interviewers to be trained in the Reminder Call effort. Interviewers were trained on this section of the instrument, protocols for contacting respondents and handling refusals, and were given time to practice these calls. Each interviewer completed a mock call with a field supervisor before they began to call actual respondents.

UWSC invited interviewers to Sterling Hall on July 26, 2016 for an in-person training on the Return Visit effort. Interviewers were trained on this section of the instrument, protocols for assisting with completion of the SAQ, and facilitating the Cognitive Telephone Interview. Interviewers were given time to practice the visit on their own and with volunteers and completed a “certification” to demonstrate mastery of this part of the MKE-2 effort.

Interviewer Observation Questions

In order to minimize burden on the respondent while hosting the interviewer in their home, interviewer observation questions were programmed into the CAPI instrument as a separate module that could be completed by the interviewer at a later time.

The interviewer observation items were the same as those asked in 2005. They contained some open-ended items where interviewers stated their observations about the respondent, the household, and the neighborhood where the household was located. While interviewers were trained to be as objective as possible when answering questions on the form, some subjective views may have crept in.

Quality Control

At the beginning of the CAPI interview, respondents were asked for their consent to have the interview recorded. The audio-recordings were used only for quality control conducted by the CAPI Supervisor or a specially-trained UWSC staff member fluent in CAPI interviewing protocols. QC was conducted on approximately 10% of all completed CAPI interviews. Interviewers were provided with timely feedback on their administration of the CAPI interview and their adherence to protocols.

Verification Interviews

UWSC employed “verification interviews” to follow-up on a random selection of at least 10% of each interviewer’s completed cases. A trained specialist at UWSC called respondents to confirm key details about the circumstances of the completed interview, and that the respondent had been treated with the utmost respect and care. These verifications ensured that protocols and procedures apart from what could be heard in the audio recordings were being followed in the field.

Weekly Conference Calls

Interviewers were required to attend a weekly conference call with the Field Supervisors. This provided interviewers with an opportunity to interact with project staff and colleagues as well as to debrief and stay up-to-date with protocol and procedures.

Cognitive Interviewer Training

See separate report prepared by Vicki Lein, dated July 2017.

Data Entry Protocol and Staff Training

Data entry for the MIDUS Milwaukee SAQs began in July 2016. The SAQ booklet was 44-pages long and included various types of formatted questions, making them more complex to enter. Following the previous MIDUS SAQ data entry protocols, each booklet was first reviewed by an “editor” to uncover and resolve any issues that could cause data entry error. Editors were trained on how to resolve the most common problem issues, such as respondents who gave multiple answers, selected answers that fell between actual response categories, or followed skip patterns incorrectly.

Editors and data entry staff underwent 2 hours of MIDUS-specific training to make them familiar with the instrument, train them in the specific protocols set for the project, and give them an opportunity to ask questions about the data entry process. Each booklet was blind double-entered by two different data entry staff members. When a discrepancy between the first pass and the second was found by the computer, the data entry person was alerted to the difference in responses, and they then determined the correct answer (with help from an editor if needed) and then made the correction to the error, either from the first or second pass.

Interim and Final Data Deliveries

Delivery of Contact Information

Historically, UWSC would provide regular deliveries of what was referred to as “The Shell”. This file contained a variety of information needed at IOA, such as respondent contact information, demographic variables, interviewer assessments, call notes, and mailing and completion dates. This provided IOA with information to use in assigning completed cases to other projects.

However, given the still relatively recent development of both the IOA MSQ sample database and the UWSC project operations database (POD), contact information only was delivered in one file at the end of the MKE-2 field period. While still referred to as the “Shell” delivery, this MKE-2 file did not contain other information such as demographic variables, interviewer assessments, etc.

Delivery of Interim Data Files

In July 2016, less than one month after production calling began, UWSC delivered an interim data set of the first 58 cases to complete the CAPI interview, so that IOA staff could review and be sure all variables were being asked correctly. In late July 2016, interim SAQ data for the first 50 cases data entered was delivered. Cognitive interview data for the MKE-2 effort was delivered on a regular basis to researchers at Brandeis during the field period.

Final Data Deliveries

Final data delivery for the Milwaukee CAPI data took place in March 2017. The final SAQ data was delivered in June 2017. These deliveries consisted of 394 CAPI cases and 327 SAQs. Final data delivery for MKE-2 Cognitive interview effort occurred in July 2017.

Response Rates

Table 1. Response Rates Across Data Collection Phases

Type of Sample	Main CAPI Survey	SAQ Survey	Cognitive Survey
MKE-2	78.6%	84.1%	84.8%

Above response rates reported as AAPOR 1 calculation.

309 respondents participated in all three phases (CAPI, SAQ, Cognitive)

18 respondents participated in CAPI and SAQ but not Cognitive

21 respondents participated in CAPI and Cognitive but not SAQ

41 respondents participated in CAPI only

The UWSC completed a total of 389 interviews and 5 partial interviews: 362 in-person, and 27 by telephone.

The overall raw response rate for the survey is 75% (389 completes / 518 cases fielded).

Table 2 includes the sample disposition for all sample members by category.

AAPOR Response Rates 1 and 2 are reported below. A detailed summary of the contact outcomes is available in Table 3.

Table 2. Overall Sample Disposition (N=518)

Final Disposition	Cases
Completed Interview (Category 1)	389
Partial Interview (Category 1)	5
Eligible, non-interview (Category 2)	38
Unknown Eligibility, non-interview (Category 3)	63
Not Eligible (Category 4)	23
Totals	518

AAPOR Response Rate 1

of completed interviews

$$\frac{((\text{Complete interviews} + \text{Partial interviews}) + (\text{Eligible, non-interview}) + (\text{Unknown Eligibility, non-interview}))}{(389 + 5 + 38 + 63 = 495)}$$

389

$$(389 + 5 + 38 + 63 = 495)$$

$$389 / 495 = 78.6\%$$

AAPOR Response Rate 2

of completed interviews + # of partial interviews

$$\frac{\text{# of completed interviews + \# of partial interviews}}{((\text{Complete interviews} + \text{Partial interviews}) + (\text{Eligible, non-interview}) + (\text{Unknown Eligibility, non-interview}))}$$

$$389 + 5$$

$$(389 + 5 + 38 + 63 = 495)$$

$$394 / 495 = 79.6\%$$

Table 3. Contact Dispositions by Specific Outcome

Final Disposition	AAPOR Code	Cases
Interview (Category 1)		
Complete	1110	389
Partial Complete	1200	5
Eligible, non-interview (Category 2)		
Household-level refusal	2111	2
Respondent refusal	2112	28
Physically / Mentally Unable to Interview	2320	7
Incarcerated	4520	1
Unknown eligibility, non-interview (Category 3)		
Unable to reach	3170	63
Not eligible (Category 4)		
Deceased	2310 & 2311	21
Out of Sample (Interviewed ineligible person at baseline)	4100	2
TOTAL		518
